
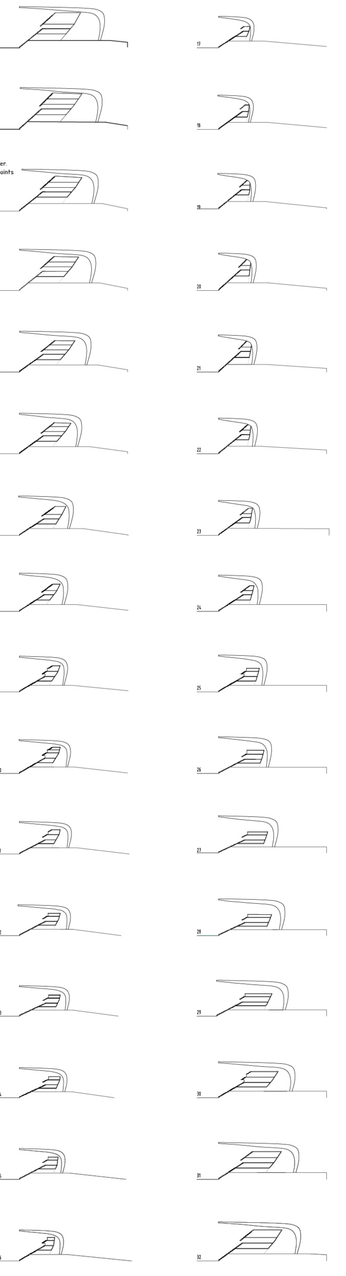
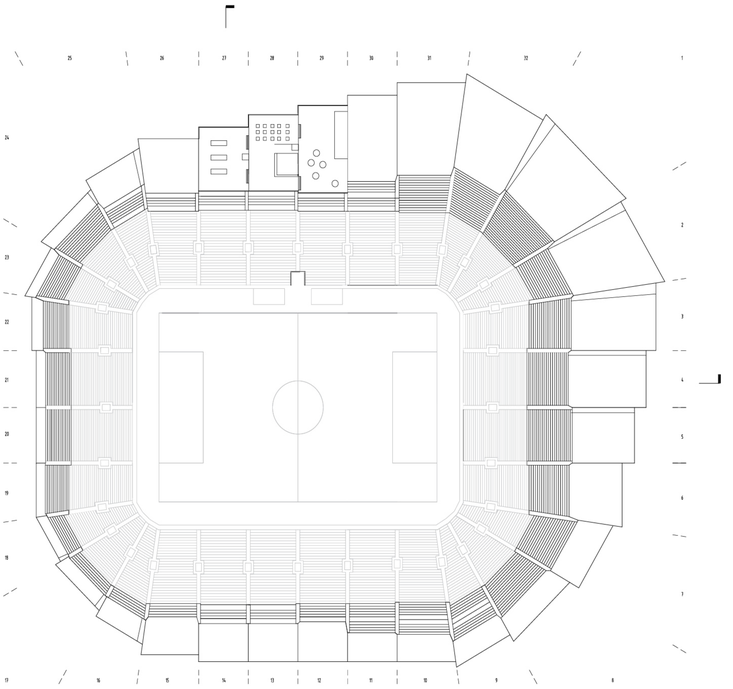
INTERMEDIATE ZONE

The intermediate zone describes the area between the exterior skin and the internal stands of the stadium. The project enhances the activity within the central focal point of the site by concentrating the additional program of the stadium within the vicinity of this area. The main stand is essentially extened around to one third of the stadium to house additional conference and community programs. The skin peels away from the internal bowl , creating a foyer for the stadium allowing greater crowd and security control during game time. In non-game time the space is used as access to the internal office, conference and restaurant facilities. It also acts a recreation space with internal rock climbing wall and protection from the weather in winter, with access to public amenities such as toilets and kiosks. The pitch can also be used for inter-school sports tournaments.

SECTIONAL DIAGRAMS through STANDS 1 - 32
the design process was studying the relationship between truss, program and foyer. scale and program are manipulated around the stands to control the activity at points around the site.





PLAN of STADIUM INTERIOR 1:500
the stands are rotated around the plan. separated by stairways. this controls the varying angles of the stands.
